

## RUBBER TRACK PAD

GR Bond Rubber Track Pads are used for Sensor Paver Machine and Excavator. The medium grade Polyurethane Track Pads combines the best qualities of Polyurethane and high quality Rubber to provide a durable and long life. Track Pads are conventional and interchangeable short pitch types. These pads are designed for low ground pressure application on construction and agricultural equipment. It increases traction and protections for delicate surfaces that would be damaged by exposed steel tracks. These Track Pads offers longer operational life and are least expensive. GR BOND Rubber Track Pads are available in variety of shape and wide range of sizes to fit many types of constructional & agricultural machineries.

The track Pads are used in Sensor Paver Machine. The Sensor Pavers are Manufactured by various Manufacturing/companies such as TITAN, VOGALEE, DYNAPACK, BITELLI & Writgen In this machines these track pads are used for chain's durability.

The Rubber Pads protect the road surfaces and reduces noise. The Rubber Pads have excellent stability & easy to attaching or detaching. The rubber pads are designed to last longer. The surface area of the segment with ground has been expanded making it possible for each pad to uphold the weight with greater efficiency. This is because the weight load per segment is lightened by the virtue of the surface contact area having been enlarged. Together with the cut resistant, anti appraising, antilear rubber formulation, it provides superior durability.

Track Pads are made of it two types of Rubber Material (I) Natural Rubber (II) Polyurethane.

The Track Pads has two parts (1) steel base (2) Rubber /Polyurethane part.. The Rubber/Polyurethane can be moulded with steel parts with suitable metal bonding.
